

APPLICATION MAPPING

NOVEMBER 2011

Configure Consulting has industry-leading expertise and a comprehensive delivery framework for Application Mapping services and solutions

LEVERAGING THE POWER OF DISCOVERY AND CONFIGURATION MANAGEMENT

Application mapping is a configuration management solution that leverages dynamic views of IT architecture to support change management, incident resolution, infrastructure analysis, internal audit and a number of security initiatives. Application maps are developed using automated discovery and configuration management tools. A discovery probe is deployed into a customer-defined segment of the organization's IT infrastructure.

The probe collects and feeds information about hardware, software, physical and virtual assets into a configuration management database. The collected information can be used to create visual representations of the infrastructure components and the interrelationships that makeup the customer's business applications and services. These representations are dynamic and automatically updated as the discovery probe routinely gathers new information.

Application maps have powerful and comprehensive impact analysis functionality, which empowers IT managers to visualize the impact of any disruption or planned change. This technology enhances efficiency and accuracy of architecture, change management, business continuity, security and compliance, and recourse optimization processes.

MORE INFORMATION

Configure Consulting is an HP Partner organization with offices in the US and Canada. We specialize in asset management, infrastructure discovery, service management, business service monitoring and automation solutions.
